Overview

The Canto® Cumulus Email Cataloger module enables Cumulus to automatically catalog email and assets from a mail server. Users attach assets to email they send to a central email account. Cumulus checks that email account and catalogs all email and attachments it finds. Attachment asset records are automatically related to the email asset record by Cumulus. Cumulus Email Cataloger offers network-secure uploads of photos taken with mobile devices, security cameras etc.

For details on all Canto's Digital Asset Management products and services go to www.canto.com

Installation & Registration

This add-on module expands the functionality of a Cumulus 8.0 (or later) installation. It is already included in the Cumulus Client and Cumulus Server software. This means that it does not need to be installed separately. In order to get the full functionality, the Cumulus Administrator has to enter the corresponding license information into the License dialog of the Remote Admin module. (Add the serial number first, then register with Canto and after that replace your license information with the new one you received that will activate your Cumulus system including this new module. For a detailed description, see the Installation Guide.)

Product Documentation

For more information, see the Cumulus Administrator Guide section "Scheduler Manager" in the chapter "Server Console".
