Overview

The Canto® Cumulus InDesign Extended Pack enables Cumulus users to catalog pages within InDesign documents. In addition to creating a record for the entire InDesign document, it creates records for each page of the InDesign document.

The Cumulus InDesign Extended Pack includes:

- InDesign AssetStore
- HELIOS XPV AssetStore (requires HELIOS ImageServer)

Note that the InDesign AssetStore requires Cumulus TAG files that were created by the Cumulus plug-in for Adobe InDesign. (For more information on this plug-in see its Read Me file in the Adapters folder of a Cumulus Client installation.) The HELIOS XPV AssetStore requires the XPV files that were created by the HELIOS XPV plug-in for Adobe InDesign.

The Cumulus InDesign Extended Pack enables you to create previews and thumbnails for pages of InDesign documents. Also the metadata of the pages can be captured although a page is not regarded as a single page document.

For details on all Canto's Digital Asset Management products and services go to www.canto.com

Installation

This add-on module expands the functionality of a Cumulus 8.0 (or later) edition.

It is already included in the Cumulus Client and Cumulus Server software. This means that it does not need to be installed separately. To activate it, you just have to enter the corresponding license information into the License dialog. (Add the serial number first, then register with Canto and after that replace your license information with the new one you received that will activate your Cumulus system including this new Option. For a detailed description, see the Installation Guide.)

Product Documentation

For more information on the AssetStores, see Client User Guide.
