

Cumulus® „Usage Statistics & Reporting“ Module

- Overview
- Installation & Registration
- Product Documentation

Overview

This Canto® Cumulus add-on module enables Cumulus to generate reports based on all statistics collected by Cumulus 8 Servers. In addition to reporting on catalog statistics (number of previews, print outs, mail to, etc.), reports can be based on Cumulus 8 Server activity, such as successful and failed search results, client connection rates, and more.

For details on all Canto's Digital Asset Management products and services go to www.canto.com

Installation & Registration

This add-on module expands the functionality of a Cumulus 8.0 (or later) installation. It is already included in the Cumulus Client and Cumulus Server software. This means that it does not need to be installed separately. In order to get the full functionality, the Cumulus Administrator has to enter the corresponding license information into the License dialog of the Remote Admin module. (Add the serial number first, then register with Canto and after that replace your license information with the new one you received that will activate your Cumulus system including this new module. For a detailed description, see the Installation Guide.)

Product Documentation

For more information, see the Cumulus Administrator Guide section "Report Manager" in the chapter "Server Console".
